Plus	Minus	Interesting
-Renewable energy sources: solar panels, wind turbines, and hydraulic power plants. -Ecofriendly products: Reusable water bottles and energy efficient appliances Online shopping(no need to use gas to go to stores) Gps tracking has minimized carbon emissions by making sure vehicles take the most efficient path to their destination.	Pollution: manufacturing and transportation create harmful by-products like carbon emissions that have a negative impact on air and water quality Deforestation: Because humans have a demand for agriculture, housing, and industry, natural habitats like forests are being destroyed at an alarming rate	I would like to know more about how we can minimize the damage that technology has on the environment. I would also like to know How we could spread awareness about the pollution that technology causes. Can we spread awareness on social media or can we do it a different way?

1. The main idea is How the environment is affected by technology. In the videos it shows the negative and the positive ways that technology can affect the environment. Some positive things were that technology created renewable energy sources and eco friendly products that help reduce pollution on the environment. The negative things were that technology causes pollution to our air and the ocean and that technology can get rid of habitats through means like deforestation.
2. The technology in the video is good and bad. The reason why technology is good and bad is because technology has created things like eco-friendly products and renewable energy sources but it also causes pollution to the air and water and causes the loss of habitats through deforestation.
